LEARNING POINTS / ACTIONS TAKEN

• British standards, including BS EN 349, provide minimum gaps to avoid crushing parts of the human body and additional information to assist reviews of machinery placement.
• Check that there is sufficient clearance between rail mounted machinery and other machinery and obstructions which may be present (particularly on end rails).
• Check that a suitable and sufficient risk assessment of machinery operation has been carried out for multi-line stressing systems.

Check that suitable control measures are in place to deal with any risk from machines passing on adjacent lines
