

*'Prodder' travels around the site with the backactor*

*'Prodder' attaches to backactor using quick hitch coupler*

*Backactor operator positions the truck so the wedged rock is close to the ground using 2-way radio communication with the truck operator*

*Backactor operator positions the 'prodder' above the rock between the wheels of the truck, the rock is removed in a downward motion so any stored energy is directed into the ground.*
